**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>
	10/713,776	KUMAR, ALOK
	<b>Examiner</b>	<b>Art Unit</b>
	Arpan P. Savla	2185

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

1) Responsive to communication(s) filed on 28 August 2007.

2a) This action is **FINAL**.                    2b) This action is non-final.

3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

4) Claim(s) 1-37 is/are pending in the application.

4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.

5) Claim(s) \_\_\_\_\_ is/are allowed.

6) Claim(s) 1-37 is/are rejected.

7) Claim(s) \_\_\_\_\_ is/are objected to.

8) Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

9) The specification is objected to by the Examiner.

10) The drawing(s) filed on \_\_\_\_\_ is/are: a) accepted or b) objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a) All    b) Some \* c) None of:

1. Certified copies of the priority documents have been received.
2. Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### Attachment(s)

1) Notice of References Cited (PTO-892)

2) Notice of Draftsperson's Patent Drawing Review (PTO-948)

3) Information Disclosure Statement(s) (PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_.

4) Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.

5) Notice of Informal Patent Application

6) Other: \_\_\_\_\_.

## DETAILED ACTION

### Response to Amendment

This Office action is in response to Applicant's communication filed August 28, 2007 in response to the Office action dated May 31, 2007. Claims 1, 11, 24, 27, and 30 have been amended. Claims 1-37 are pending in this application.

### Claims

1. It should be noted that Applicant's amendments to claim 1 are non-compliant under 37 CFR 1.121 c(2) because the text of the added subject matter is not shown by underlining the added text. However, in an effort to advance prosecution the Examiner has issued an Office action on the merits instead of a notice of non-compliant amendment.

### REJECTIONS BASED ON PRIOR ART

#### Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-2, 4-5, 11-12, 14-15, 21-22, 24-25, 27-28, 30-31, and 33-37 are rejected under 35 U.S.C. 103(a) as being obvious over Pereira et al. (U.S. Patent 6,697,276) (hereinafter "Pereira") in view of Wolrich et al. (U.S. Patent Application

**Publication 2003/0115347) (hereinafter “Wolrich”) with “Howstuffworks “What is a packet?” by Marshall Brain” (hereinafter “Howtuffworks”) offered as extrinsic evidence.**

4. As per claims 1 and 11, Pereira discloses allocating a memory entry in a memory device to executable instructions to be executed; and including a unique identifier assigned to the executable instructions in a portion of the memory entry (col. 7, lines 7-21; col. 18, lines 36-49; Fig. 6, element 190). *It should be noted that computer program product in claims 11-20 executes the exact same functions as the methods in claims 1-10. Therefore, any references that teach claims 1-10 also teach the corresponding claims 11-20. It should be noted that the instructions within the packet headers of the “IPv4 pools, IPv6 pools, and MPLS pools” are analogous to the “executable instructions.” The Examiner notes Howstuffworks, the bullet point entitled “header” on page 2, which discloses that packet headers contain instructions. It should also be noted that the “hash CAM blocks” are analogous to “memory entries allocated to instructions.” Lastly, it should also be noted that the “entry type value” is analogous to the “unique identifier.”*

Pereira does not expressly disclose a multithreaded engine included in a packet processor.

Wolrich discloses a multithreaded engine included in a packet processor (paragraph 0014, lines 2-7; paragraph 0012, lines 1-4; Fig. 2, elements 18 and 21). *It should be noted that the “network processor” is analogous to the “packet processor,”*

Pereira and Wolrich are analogous art because they are from the same field of endeavor, that being content addressable memory (CAM).

At the time of the invention it would have been obvious to a person of ordinary skill in the art to use Wolrich's multithreaded engine included in a packet processor to execute data packets within Pereira's CAM device.

The motivation for doing so would have been to not have the processor lie idle while waiting for all steps of the first instruction to be completed, therefore, pipelining can lead to improvements in system performance (Wolrich, paragraph 0014, lines 11-13).

Also, at the time of the invention it would have been obvious to a person of ordinary skill in the art to apply packet processing (a known technique) to a CAM (a known device) ready for improvement to yield the predictable results of packet forwarding and classification operations within the network switch or router that houses the CAM.

Therefore, it would have been obvious to combine Pereira and Wolrich for the benefit of obtaining the invention as specified in claim 1.

5. As per claim 2 and 12, the combination of Pereira/Wolrich discloses maintaining a count of threads that use the memory entry (Pereira, col. 56, lines 27-34).

6. As per claim 4 and 14, the combination of Pereira/Wolrich discloses maintaining the count includes incrementing the count to represent a thread initiating use of the memory entry (Pereira, col. 56, lines 27-30). *It should be noted that when taking the broadest interpretation of the claim language it is clear that the limitations of the claim*

*do not specify what determines “initiating use of the memory entry.” Pereira discloses insertion of a CAM entry, thus, “initiating use of a CAM entry.”*

7. **As per claim 5 and 15,** the combination of Pereira/Wolrich discloses maintaining the count includes decrementing the count to represent a thread halting use of the memory entry (col. 56, lines 30-34). *It should be noted that when taking the broadest interpretation of the claim language it is clear that the limitations of the claim do not specify what determines “halting use of the memory entry.” Pereira discloses deletion of a CAM entry, thus, “halting use of a CAM entry.”*

8. **As per claim 21,** Pereira discloses a memory manager comprises:

a process to:

allocate a memory entry in a memory device to executable instructions to be executed and include a unique identifier assigned to the executable instructions in a portion of the memory entry (col. 7, lines 7-21; col. 18, lines 36-49; Fig. 6, element 190).

*See the citation note for the similar limitation in claim 1 above.*

Pereira does not expressly disclose a multithreaded engine included in a packet processor.

Wolrich discloses a multithreaded engine included in a packet processor (Wolrich, paragraph 0014, lines 2-7; paragraph 0012, lines 1-4; Fig. 2, elements 18 and 21).

Pereira and Wolrich are analogous art because they are from the same field of endeavor, that being content addressable memory (CAM).

At the time of the invention it would have been obvious to a person of ordinary skill in the art to use Wolrich's multithreaded engine included in a packet processor to execute data packets within Pereira's CAM device.

The motivation for doing so would have been to not have the processor lie idle while waiting for all steps of the first instruction to be completed, therefore, pipelining can lead to improvements in system performance (Wolrich, paragraph 0014, lines 11-13).

Also, at the time of the invention it would have been obvious to a person of ordinary skill in the art to apply packet processing (a known technique) to a CAM (a known device) ready for improvement to yield the predictable results of packet forwarding and classification operations within the network switch or router that houses the CAM.

Therefore, it would have been obvious to combine Pereira and Wolrich for the benefit of obtaining the invention as specified in claim 21.

9. As per claim 22, Pereira discloses a process to maintain a count of threads that use the memory entry (col. 56, lines 27-34).

Wolrich discloses a multithreaded engine (paragraph 0014, lines 2-7; Fig. 2, element 21).

10. As per claim 24, Pereira discloses a system to allocate a memory entry in a memory device to executable instructions to be executed and include a unique identifier assigned to the executable instructions in a

Art Unit: 2185

portion of the memory entry (col. 7, lines 7-21; col. 18, lines 36-49; Fig. 6, element 190).

*See the citation note for the similar limitation in claim 1 above.*

Pereira does not expressly disclose a multithreaded engine included in a packet processor.

Wolrich discloses a multithreaded engine included in a packet processor (Wolrich, paragraph 0014, lines 2-7; paragraph 0012, lines 1-4; Fig. 2, elements 18 and 21).

Pereira and Wolrich are analogous art because they are from the same field of endeavor, that being content addressable memory (CAM).

At the time of the invention it would have been obvious to a person of ordinary skill in the art to use Wolrich's multithreaded engine included in a packet processor to execute data packets within Pereira's CAM device.

The motivation for doing so would have been to not have the processor lie idle while waiting for all steps of the first instruction to be completed, therefore, pipelining can lead to improvements in system performance (Wolrich, paragraph 0014, lines 11-13).

Also, at the time of the invention it would have been obvious to a person of ordinary skill in the art to apply packet processing (a known technique) to a CAM (a known device) ready for improvement to yield the predictable results of packet forwarding and classification operations within the network switch or router that houses the CAM.

Therefore, it would have been obvious to combine Pereira and Wolrich for the benefit of obtaining the invention as specified in claim 24.

11. **As per claim 25**, Pereira discloses a system configured to maintain a count of threads that use the memory entry (col. 56, lines 27-34).

Wolrich discloses a multithreaded engine (paragraph 0014, lines 2-7; Fig. 2, element 21).

12. **As per claim 27**, Pereira discloses a network forwarding device to allocate a memory entry in a memory device to executable instructions to be executed and include a unique identifier assigned to the executable instructions in a portion of the memory entry (col. 7, lines 7-21; col. 18, lines 36-49; Fig. 6, element 190).

*See the citation note for the similar limitation in claim 1 above.*

Pereira does not expressly disclose a network forwarding device comprising:  
an input port for receiving packets;  
an output for delivering the received packets;  
a network processor;  
and a multithreaded engine included in a packet processor.

Wolrich discloses a network forwarding device comprising:  
an input port for receiving packets (paragraph 0011, lines 1-3; Fig. 1, element 12);  
an output for delivering the received packets (paragraph 0011, lines 3-5; Fig. 1, element 16);  
a network processor (paragraph 0011, lines 5-8; Fig 1, element 18);

and a multithreaded engine included in a packet processor (Wolrich, paragraph 0014, lines 2-7; paragraph 0012, lines 1-4; Fig. 2, elements 18 and 21).

Pereira and Wolrich are analogous art because they are from the same field of endeavor, that being content addressable memory (CAM).

At the time of the invention it would have been obvious to a person of ordinary skill in the art to use Wolrich's multithreaded engine included in a packet processor to execute data packets within Pereira's CAM device.

The motivation for doing so would have been to not have the processor lie idle while waiting for all steps of the first instruction to be completed, therefore, pipelining can lead to improvements in system performance (Wolrich, paragraph 0014, lines 11-13).

Also, at the time of the invention it would have been obvious to a person of ordinary skill in the art to apply packet processing (a known technique) to a CAM (a known device) ready for improvement to yield the predictable results of packet forwarding and classification operations within the network switch or router that houses the CAM.

Therefore, it would have been obvious to combine Pereira and Wolrich for the benefit of obtaining the invention as specified in claim 27.

13. As per claim 28, Pereira discloses a network forwarding device configured to maintain a count of threads that use the memory entry (col. 56, lines 27-34).

Wolrich discloses a multithreaded engine (paragraph 0014, lines 2-7; Fig. 2, element 21).

14. As per claim 30, Pereira discloses a method comprising:

allocating a content-addressable-memory (CAM) entry to an executable microblock and including a unique identifier assigned to the executable microblock in a portion of the CAM entry. (col. 7, lines 7-21; col. 18, lines 36-49; Fig. 6, element 190). *It should be noted that each “pool” is analogous to a “microblock.”*

Pereira does not expressly disclose a multithreaded microengine included in a network processor.

Wolrich discloses a multithreaded microengine included in a network processor (paragraph 0014, lines 2-7; paragraph 0012, lines 1-4; Fig. 2, elements 18 and 21).

Pereira and Wolrich are analogous art because they are from the same field of endeavor, that being content addressable memory (CAM).

At the time of the invention it would have been obvious to a person of ordinary skill in the art to use Wolrich’s multithreaded engine included in a packet processor to execute data packets within Pereira’s CAM device.

The motivation for doing so would have been to not have the processor lie idle while waiting for all steps of the first instruction to be completed, therefore, pipelining can lead to improvements in system performance (Wolrich, paragraph 0014, lines 11-13).

Also, at the time of the invention it would have been obvious to a person of ordinary skill in the art to apply packet processing (a known technique) to a CAM (a known device) ready for improvement to yield the predictable results of packet

forwarding and classification operations within the network switch or router that houses the CAM.

Therefore, it would have been obvious to combine Pereira and Wolrich for the benefit of obtaining the invention as specified in claim 30.

15. **As per claim 31**, Pereira discloses maintaining a count of threads that use the CAM entry (col. 56, lines 27-34).

Wolrich discloses a multithreaded microengine (paragraph 0014, lines 2-7; Fig. 2, element 21).

16. **As per claims 33-37**, Pereira discloses the memory entry comprises a content-addressable memory entry (col. 18, lines 36-37).

17. **Claims 3, 6-10, 13, 16-20, 23, 26, 29, and 32 are rejected under 35 U.S.C. 103(a) as being obvious over Pereira in view of Wolrich as applied to claims 1, 21, 24, 27, and 30 above, and further in view of Litt et al. (U.S Patent Application Publication 2003/0126358) (hereinafter “Litt”).**

18. **As per claims 3 and 13**, the combination of Pereira/Wolrich discloses all the limitations of claim 3 except maintaining a bit to represent availability of the memory entry for thread use.

Litt discloses maintaining a bit to represent availability of the memory entry for thread use (paragraph 0035, lines 7-9; Fig. 1, element 170). *It should be noted that the “output of the AND gate” is either a high or low voltage. A bit is represented physically by either a high or low voltage. Therefore, the “output of the AND gate” is analogous to a “bit.”*

The combination of Pereira/Wolrich and Litt are analogous art because they are from the same field of endeavor, that being content addressable memory (CAM).

At the time of the invention it would have been obvious to a person of ordinary skill in the art to implement Litt's valid bit within Pereira/Wolrich's CAM block.

The motivation for doing so would have been to have a technique which permits software loops to be detected and eliminates multiple iterations of a software loop from being stored in memory as part of a PC trace, thus, reducing memory consumption (Litt, paragraph 0018, lines 1-4).

Therefore, it would have been obvious to combine Pereira, Wolrich, and Litt for the benefit of obtaining the invention as specified in claims 3 and 13..

19. As per claims 6 and 16, the combination of Pereira/Wolrich/Litt discloses maintaining the bit includes setting the bit to represent availability of the memory entry for thread use (Litt, paragraph 0036, lines 25-32).

20. As per claims 7 and 17, the combination of Pereira/Wolrich/Litt discloses maintaining the bit includes clearing the bit to represent unavailability of the memory entry for thread use (Litt, paragraph 0036, lines 32-38).

21. As per claims 8 and 18, the combination of Pereira/Wolrich/Litt discloses checking the bit to determine the availability of the memory entry for thread use (Litt, paragraph 0035, lines 7-9).

22. As per claims 9 and 19, the combination of Pereira/Wolrich/Litt discloses the unique identifier includes four bits (Litt, paragraph 0037, lines 4-5; paragraph 0038, lines 26-27). *It should be noted that "Mask signal" is analogous to "unique identifier."*

23. As per claims 10 and 20, the combination of Pereira/Wolrich discloses a multithreaded engine of the packet processor (Wolrich, paragraph 0014, lines 2-7; paragraph 0012, lines 1-4; Fig. 2, elements 18 and 21).

Litt discloses the memory entry identifies a location in a local memory (paragraph 0019, lines 4-8). *It should be noted that "instruction address" is analogous to "identifier of a location in a local memory."*

24. As per claim 23, the combination of Pereira/Wolrich/Litt discloses a process to maintain a bit to represent availability of the memory entry for thread use (Litt, paragraph 0035, lines 7-9; Fig. 1, element 170).

25. As per claim 26, the combination of Pereira/Wolrich discloses a packet processor (Wolrich, paragraph 0012, lines 1-4; Fig. 2, element 18).

Litt discloses maintaining a bit to represent availability of the memory entry for thread use (paragraph 0035, lines 7-9; Fig. 1, element 170).

26. As per claim 29, the combination of Pereira/Wolrich discloses a network processor (Wolrich, paragraph 0012, lines 1-4; Fig. 2, element 18).

Litt discloses maintaining a bit to represent availability of the memory entry for thread use (paragraph 0035, lines 7-9; Fig. 1, element 170).

27. As per claim 32, the combination of Pereira/Wolrich/Litt discloses maintaining a bit in a status register to represent availability of the CAM entry to identify a local memory location (Litt, paragraph 0038, lines 3-5; Fig. 2, element 250).

**Response to Arguments**

28. Applicant's arguments filed August 28, 2007 with respect to claims 1-37 have been fully considered but they are not persuasive.

29. With respect to Applicant's argument beginning in the last paragraph on page 9 through the first full paragraph on page 10 of the communication filed August 28, 2007, the Examiner respectfully disagrees. Applicant alleges the logical group is not included in the hash CAM block, however, as the Examiner has set forth in the rejections above, the "hash CAM blocks" are analogous to "memory entries allocated to instructions" and the "entry type value" is analogous to the "unique identifier", and as can be seen in the cited portion of Pereira, the entry type value is included within a register which is in the hash CAM block. Thus, Pereira discloses including a unique identifier (i.e. entry type value) assigned to the executable instructions (i.e. the packet headers of the IPv4 pools, IPv6 pools, and MPLS pools) in a portion of the memory entry (i.e. the hash CAM block). Accordingly, the combination of Pereira/Wolrich sufficiently discloses claim 1.

30. With respect to Applicant's argument beginning in the first full paragraph on page 11 through the first full paragraph on page 12 of the communication filed August 28, 2007, the Examiner respectfully disagrees. Firstly, in response to Applicant's argument that the Examiner's conclusion of obviousness is based upon improper hindsight reasoning, it must be recognized that any judgment on obviousness is in a sense necessarily a reconstruction based upon hindsight reasoning. But so long as it takes into account only knowledge which was within the level of ordinary skill at the time the claimed invention was made, and does not include knowledge gleaned only from the

applicant's disclosure, such a reconstruction is proper. See *In re McLaughlin*, 443 F.2d 1392, 170 USPQ 209 (CCPA 1971).

Assuming, *in arguendo*, that conclusion of obviousness based on the teaching, suggestion, motivation (TSM) rationale is based on improper hindsight reasoning, the Examiner has provided an additional rationale to support the conclusion of obviousness. The Examiner respectfully notes the Supreme Court Decision in *KSR International Co. v. Teleflex Inc.*, 550 U.S.---, 82 USPQ2d 1385 (2007). According to the Supreme Court, the TSM test is one of a number of valid rationales that could be used to determine obviousness under 35 U.S.C. § 103. It is not the only rationale that may be relied upon to support a conclusion of obviousness. Not finding TSM does not imply non-obviousness. As can be seen from the 103 rejections above, to support a conclusion of obviousness the Examiner has also relied on the rationale of applying a known technique to a known device ready for improvement to yield predictable results. Accordingly, the Examiner's conclusion of obviousness based on the combination of Pereira/Wolrich is sufficiently supported.

31. As per Applicant's arguments with respect to independent claims 11, 21, 24, 27, and 30 the Examiner respectfully disagrees for the same reason as discussed above with respect to independent claim 1.

32. As for Applicant's arguments with respect to the dependent claims, the arguments rely on the allegation that independent claim 1 is allowable and therefore for the same reasons the dependent claims are allowable. However, as addressed above,

independent claim 1 is not allowable, thus, Applicant's arguments with respect to the dependent claims are not persuasive.

**Conclusion**

**STATUS OF CLAIMS IN THE APPLICATION**

The following is a summary of the treatment and status of all claims in the application as recommended by MPEP 707.70(i):

**CLAIMS REJECTED IN THE APPLICATION**

Per the instant office action, claims 1-37 have received a second action on the merits and are subject of a second action final.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Arpan P. Savla whose telephone number is (571) 272-1077. The examiner can normally be reached on M-F 8:30-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Sanjiv Shah can be reached on (571) 272-4098. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
